Adaptive control is the control method used by a controller which must adapt to a controlled system with parameters which vary, or are initially uncertain. For example, as an aircraft flies, its mass will slowly decrease as a result of fuel consumption; a control law is needed that adapts itself to such changing conditions. Adaptive control is different from robust control in that it does not need a priori information about the bounds on these uncertain or time-varying parameters; robust control

For those interested in the state of the art in robust adaptive control, this book forms an excellent source for the interplay between robustness and dynamics of adaptive elements in control design. Whereas this text ties together developments of the past 3 decades with more classical notions, it is also a nice segue into the recent L1-adaptive control formulations.

In contrast with an adaptive control policy, a robust control policy is static, rather than adapting to measurements of variations, the controller is designed to work assuming that certain variables will be unknown but bounded.
