Rockfill dams are mainly made from dumped and compacted rock fill. Rockfill dams are permeable. They have an impermeable core or an impermeable layer on the upstream face of the dam to prevent seepage through the porous core. The impermeable parts are usually made of reinforced concrete, asphaltic concrete or clay.

### Earth / Rockfill Dams | Geengineer.org

The damage or effect of an earthquake on earth and rock-fill dams depends on the geology of the site, soil conditions, stability of the foundation, characteristics of the slopes, and slopes in the reservoir, as well as the seismo-dynamic considerations that are taken into account in the analysis of complementary structures (spillways, intake structures, etc.).

### Geotechnical Engineering Applied on Earth and Rock-Fill Dams

Inevitable seepage through dam and foundation must not endanger the safety and the durability of the structure. In addition, seepage must be considered from the viewpoint of reservoir economy and environmental impact. - the permeability of the foundation and of the abutments must be low.
