### Engine Construction Principles Of Operation

Chemical energy of the fuel is first converted to thermal energy by means of combustion or oxidation with air inside the engine, raising the T and p of the gases within the combustion chamber. The high-pressure gas then expands and by mechanical mechanisms rotates the crankshaft, which is the output of the engine.

Usually, automobile engines make use of four strokes to turn chemical energy into mechanical energy with the help of combustion of gases or hydrocarbon fuel. Principle of Operation-. In the spark ignition engine an Air/Fuel mixture is formed outside the combustion chamber. This mixture is generated in a Carburetor or by means of Fuel Injection, but in either case the final Air/Fuel mixture is fed into the Cylinder, through the Intake, past the Inlet Valve.
