Copper-Based Systems. Introduction to Network Cabling—Copper-Based Systems (C-Tech Copper) provides students with the knowledge and skills needed to become certified entry-level technicians in the Network Cabling industry. The course focuses on:

- Proper tool use and construction techniques.
- The characteristics of various industry standards.
- Troubleshooting and repair.

C-Tech, Network Cabling Copper-Based Training Program

When 10 Mbps Ethernet was most popular, during the 1980s and early 1990s, networks typically used one of two kinds of coax cable — thinnet (10BASE2 standard) or thicknet (10BASE5). These cables consist of an inner copper wire of varying thickness surrounded by insulation and another shielding. Their stiffness caused network administrators difficulty when installing

and maintaining thinnet and thicknet.

Introduction to Network Cables and Network Cable Types

These categories specify the type of copper wire -- most telephone and network wire is copper -- and jacks. The number (1, 3, 5 and so on) refers to the revision of the specification and, in practical terms, to the number of twists inside the wire -- i.e., to the quality of connection in a jack. CAT1 is typically used for telephone wire. This type of wire is not capable of supporting computer network traffic and is not twisted.

Copper cabling is usually cheaper and easier to install than fiber optic cabling. However, fiber cables generally have a much greater signaling range than copper. Why are two strands of fiber used for a single fiber optic connection? The two strands allow the data to travel for longer distances without degrading.

cabling system, though it outlives most other networking components, represents just five percent of the total network investment. The structured cable is the only one that needs to be installed to contend with the needs of telephone and data communications now and in the future. It is a system that provides a very "structured"
