The vibrating molecules emitting the radiation could have only certain discrete amounts of energy, given by $E_n = nhf$, where n is called a quantum number, F is the frequency, and h is Planck's constant given by $h = 6.626 \times 10^{-34}$ joule-seconds. Molecules emit energy in units called quanta, now called photons.

Classical Mechanics Quantum Mechanics A The state of a particle at any given time is given by the two variables $x(t)$ and $p(t)$, i.e., a point in a 2D phase space. The state of a particle is represented by a state vector $|\psi(t)\rangle$ in a Hilbert space. The projection on the basis $|x\rangle$ gives the wave function $\langle x|\psi(t)\rangle = \psi(x,t)$.

Quantum mechanics shows that light, along with all other forms of electromagnetic radiation, comes in discrete units, called photons, and predicts its spectral energies (corresponding to pure colors), and the intensities of its light beams. A single photon is a quantum, or smallest observable particle, of the electromagnetic field.
