Radioactivity and Nuclear Reactions Chapter Review ...

he Sun gives off tremendous amounts of energy from day to day, year to year. Almost all of the Sun's energy comes from nuclear reactions in which the nuclei of atoms are fused together. In this chapter, you will learn about unstable nuclei and how they emit different types of radiation. You will also learn how this radiation can be used to determine the age of objects, produce energy, or treat diseases.

9 Radioactivity and Nuclear Reactions

Six types of radiation produced during nuclear decay were presented within this chapter and include: alpha (α) decay which is composed of two protons and two neutrons and has a +2 charge. beta (β) decay which is an electron ejected from the nucleus (not from the shells of electrons about the nucleus) and has a -1 charge and no mass.

Radioactivity part 1(basic atomic and nuclear physics)

Radioactivity is the spontaneous breakdown of an atom's nucleus by the emission of particles and/or radiation. Radiation is the emission of energy through space in the form of particles and/or waves. Nuclear reactions are very different from chemical reactions.

Kinetics of radioactive decay All radioactive decays obey first-order kinetics. The Chapter 19 formula $\ln[A]_t - \ln[A]_0 = -kt$ or $\ln \frac{[A]_t}{[A]_0} = -kt$ or $[A]_t = [A]_0 e^{-kt}$ becomes $\ln \frac{N}{N_0} = -kt$ and $\ln 2 = -k t_{1/2}$ so that $t_{1/2} = \frac{0.693}{k}$ where N = number of radioactive nuclei We can use this kinetics to date objects.

Chapter 20: Nuclear Chemistry

As with any nuclear process, the sums of the atomic numbers and mass numbers must be the same on both sides of the equation. Spontaneous

fission is found only in large nuclei. The smallest nucleus that exhibits spontaneous fission is lead-208. (Fission is the radioactive process used in nuclear power plants and one type of nuclear bomb.)
