An easy way to visualize a chaotic attractor is to start with a point in the basin of attraction of the attractor, and then simply plot its subsequent orbit. Because of the topological transitivity condition, this is likely to produce a picture of the entire final attractor, and indeed both orbits shown in the figure on the right give a picture of the general shape of the Lorenz attractor.

The Mandelbrot set (*/ ˈ m æ n d ə l b r ɒ t /*) is the set of complex numbers for which the function $f(z) = z^2 + c$ does not diverge when iterated from $z = c$, i.e., for which the sequence $c, f(c), f(f(c)), \dots$, remains bounded in absolute value. Its definition is credited to Adrien Douady who named it in tribute to the mathematician Benoit Mandelbrot, a pioneer of fractal geometry.

In the large extra dimensional braneworld inflation, Friedmann equation is modified to include a quadratic term in energy density with an additional parameter λ called brane tension in addition to the usual linear term. The high energy brane corrections modify the slow-roll parameters and affect the behaviour of inflation. We analyse the superconformal inflation for E-models and ...

To examine the viability of the proposed design, both SPICE simulation and experimental investigation are performed for the parameter value ($\alpha = 2$, $\beta = 20$, $\gamma = 27$). The simulation and experimental setup are done using the component value ($C_1 = 40$ nF, $C_2 = 20$ nF, $L = 2$ mH). However, the resistor R can be used as a dominant parameter and it can be tuned with a 5 k Ω potentiometer.
